PREFACE

Since the founding of Anderson MacGyver its advisors help their clients organizing technology and data. Not in a one-size-fits-all way, but driven by the requirements from the business and in the realization that different parts of the business also have their own requirements with regard to the chosen solution towards a successful digital future.

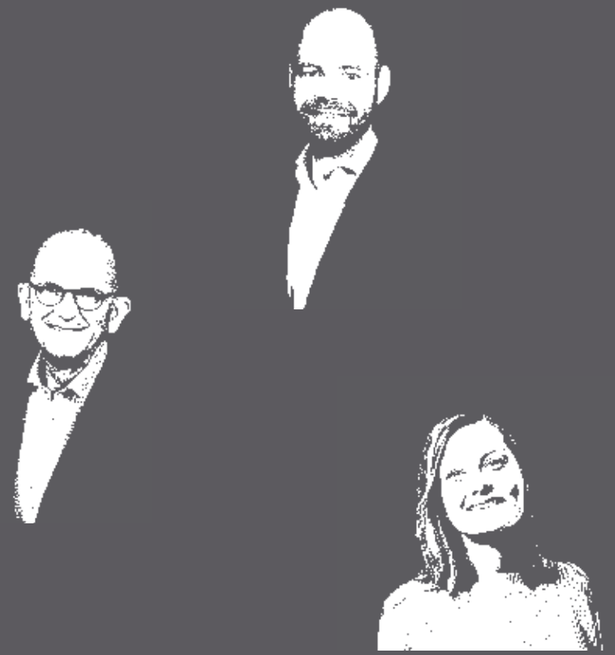

According to Anderson MacGyver, the characteristics of business activities are decisive in determining the most suitable solutions regarding technology and data. If the characteristics of activities are different, this can result in different solutions for digital technology, the way they are organized and managed, the way they are financed or in a different choice for the most viable options to source them. Sometimes it is necessary to opt for generic solutions available on the market; in other circumstances, when the future of the company needs to be secured, it can be necessary to have specific solutions in an agile setting. Depending on the situation, different requirements are imposed on the technology, the partners to be selected, and the way the organization and management must be set up.

In our way of working, we take the characteristics of individual business activities and their specific requirements as a starting point. We use our Business Activity Model to classify the business activities: our MultiModal analysis of business activities. In this white paper, we explain the Business Activity Model. The model is based on our practice over the past 8 years and has been widely applied to design tech and data organizations, governance of tech and data, in supplier selection, enterprise architecture and application rationalization. The model has been improved over time based on learning and feedback from our client assignments and scientific research.

We expect this white paper to be an inspiration to you and that it will support you in finding new insights to take the next step in your digital journey.

Lead Product Management

THE AUTHORS

ALBERT SPROKHOLT
Albert, MSc, is a principal consultant at Anderson MacGyver in the field of strategy, governance, information management, architecture and sourcing of technology and data services. He has over 30 years of technology experience in various sectors such as logistics, manufacturing, technical services, financial services, utilities and government. He worked as a CIO, managing complex technology organizations (Bührmann-Tetterode and AEGON) and was an executive member of the board of Morgan Chambers and the European Executive Committee of EquaTerra.

He is a lecturer at Nyenrode Business University and the Academy for Information Management. He is an arbiter at the SGOA (Stichting Geschillen Oplossing Automatisering) and at the NAI (Nederland Arbitrage Instituut).

FABIAN HAIJENGA
Fabian, MSc, is a senior consultant at Anderson MacGyver in strategy, business architecture and sourcing. He has over 15 years of experience in various sectors such as field services, engineering and financial service both in the Netherlands and Internationally. Fabian has a MSc. in Management, worked as consultant within KPMG and EquaTerra, and as an enterprise architect within HP EMEA. Within Anderson MacGyver, Fabian is the Lead Product Management and member of the management team.

LOTTE NIEUWMEIJER
Lotte, MSc, is a consultant at Anderson MacGyver. Before starting as a consultant, Lotte completed her MSc in Business Informatics by researching the concept of multimodality. She researched the foundation of the concept, which led to the writing of this whitepaper.

CHAPTER 1
INTRODUCTION

The world has developed into a global economy. Digital technologies accelerate the speed of change in markets and customers are empowered with increasing choices. Organizations need to devise new strategies and become more responsive. Many organizations recognize the need for a digital transformation. Digital transformations focus on the integration of digital technology into all parts of an organization. Nevertheless, digital transformation is not just about technology; it is mainly about strategy. It can fundamentally change how organizations operate and deliver value to customers. Digital transformation is also a cultural change that requires organizations to constantly challenge current practices, experiment and become familiar with failing, fast learning and repositioning.

To successfully transform an organization , it is important to establish a clear and common vision and language across the organization. Relevant stakeholders must be involved and informed about the future direction of the organization and the implications of the transformation to ensure its success. An important prerequisite for the digital transformation is having a deep understanding of an organization. The business activities that an organization performs are a solid starting point to:

- talk about strategic direction of the operating model
- determine the direction for organizing data and technology
- assess current execution and support of business activities

This white paper presents the Business Activity Model, consisting of two dimensions that determine the modality of any business activity. In the following chapters the white paper will explain the model and the application in more detail. Chapter 2 explains what we consider business activities. Chapter 3 explains the concept of dynamism in a world of globalization and rapid change and its impact on business activities. Chapter 4 explains the concept of differentiation in business activities. Chapter 5 introduces the concept of multimodality and its related model and quadrants. Chapter 6 describes how the model can be used in practice and in chapter 7 our conclusions are presented.

‘Understanding is the start of (digital) transformation.’

ORIGIN OF THE TWO DIMENSIONS
The model originates from a project conducted by Anderson MacGyver in 2014. By that time, the vertical axis was assessed by examining the specificity of a business activity (see also Sheehan and Foss, 2017). Which, in turn, originated from determining who is in control of executing the activity. The horizontal axis used to assess whether the strategic focus of a business activity was to be cost-efficient or whether the activity adds value to the customer, based on Porter (1996). In 2021, we continued to substantiate the theory behind the model, including the experience we have built up over the past 7 years with the original model. The findings of this research in the application of multimodal thinking form the basis for this white paper on multimodal business activities.

CHAPTER 2
BUSINESS ACTIVITIES

A business activity is something that an actor (human, system, machine) does by using resources (capacity, capital, expertise, data) to achieve a particular result or goal (product, service, profit, information, objective). Actors are expected to have abilities in the form of knowledge, algorithms, time and other resources.
In the context of this paper, when 'business activities' is used, we mean the activities that are carried out by an organization in the context of business operations.

Business activities provide a solid starting point for analysing organizations and the interrelationships between organizations in ecosystems and value webs*.
There are several arguments for this.
Taking an activity-based perspective on an organization helps in:

1. Understanding which core activities create a competitive advantage. These activities can be further strategically specialized to distinguish itself and remain competitive
2. Identifying the impact of each activity on a company's investment and cost behavior in relation to change and differentiation
3. Formulating competitive strategies by executing
   - activities other than those of competitors
   - similar activities in different ways
4. Identifying linkages and interrelationships between the activities. Interdependency between activities can be created within or across firms. These complex interdependencies between activities can lead to causal ambiguity and make it difficult for competitors to imitate and can lead to competitive advantages
5. Allowing to identify activities that would benefit from empowerment of managers to be able to rapidly respond to changing market. Using an activity-based perspective helps to focus on the growing hyper-competition in industries.Horizontal organizational structures with empowered managers are more likely to be able to make quick and innovative responses, which is needed in hyper competitive industries.

*See, Anderson MacGyver white paper 'Value Web' 2020

An organisation must understand which activities give them competitive advantage and which other non-core activities can be outsourced to suppliers. An activity-based view supports the identification of these core activities that should be kept in-house, and non-core activities that can be outsourced. It also helps them in the current trend of organisations increasingly collaborating and forming value chains or ecosystems with other organisations.

Furthermore, Porter (1996)_ uses an activity-based perspective in his value chain. Porter's value chain emphasizes the importance of primary and supporting activities that together deliver a product or service.

2.1

'HOW' IS NOT WITHIN THE DEFINITION OF A BUSINESS ACTIVITY

Using the concept of business activities creates a lot of space to discuss a variety of solutions to perform a business activity, taking into account the needs of customers, available resources and the context in which the activity operates. For this reason, business processes are not taken as a starting point for analysis. Processes often have a specific character without being based on a strategic necessity, but on insights from that moment. That specific character of processes is often the result of certain circumstances, of available knowledge, or the availability of certain solutions.

Based on the definition of 'activity' when determining a digital strategy, all kinds of scenarios can be analysed without being limited by the current structure of processes. For example, there are many ways to cut a sheet of paper, but the activity is still 'cut the sheet'. For the business analysis, it does not matter how this is done. In the first instance, it is about what needs to be done and with what desired result. Once this has been established, it can be determined how best to set up and implement. If far-reaching digitization is chosen, this means that the activity is preferably performed without human intervention using algorithms. However, the activity remains the same.

The way business activities are conducted changes over time: actors learn and specialize, new technologies become available. Business activities can be connected creating activity chains. Business activities can also be about the coordination and integration of other business activities in the organizations or between business partners, planning through procedures, processes and systems to act more effectively.
A business activity is a constant factor, the way of implementation changes continuously due to new insights, feedback, or dynamics in technology or environmental factors.

CHAPTER 3
DYNAMICS

Nowadays, markets and business environments are increasingly characterized by a high degree of dynamism. Digital technologies have accelerated the speed of change in markets, leading to greater environmental uncertainty. Digitalization gave customers more choice than ever before. This empowerment forces organizations to put the customer first and focus on finding ways to optimize their business activities to meet customer needs and capitalize on their experiences. We are in a situation where customer behavior is constantly changing, and it is unknown what will be demanded tomorrow. The key to survival for any organization is to be able to respond quickly to new customer-centric trends by adapting their business model and business activities.

This means that organizations must create strategic flexibility in their business activities. Flexibility will provide the ability to respond to the dynamic environment. A firm needs dynamic capabilities to be able to alter its current business activities and match them with customer demands. The art of digital business design is to determine what can be relatively stable from those elements that are constantly changing. Knowing when and how much flexibility is required to manage uncertainty is crucial. Examples of external triggers that require responses are: disruptive digital competitors, changing customer behavior, political socio-economical change and disruptive digital technologies.

However, it is often ignored that flexibility and the changes it requires come at a cost. These changes are not always necessary. Change is costly and flexibility often comes with the sacrifice of efficiency. In more stable environments, it can be more profitable to optimize operational efficiency at the expense of flexibility. These environments are less affected by disruptions and to arm against disruption efficiency has to be sacrificed. The absence of disruptions allows organizations to optimize and automate business activities.

Digital business design involves a trade-off between stability and flexibility that must be balanced in order to successfully digitally transform.

‘Dynamics stimulate creativity and innovation.’

CHAPTER 4 DIFFERENTIATION

In many industries the internet and new business tools are breaking down barriers to entry. Business owners are facing increased competition. The question is: What can an organization do to remain competitive? Organizations need to respond to increased competition and rapid evolution. That is why many organizations are specializing to differentiate themselves from competition.

The concept of differentiation focuses on standing out from the competition and giving people a reason to choose your company over others. When differentiating, one might be able to provide higher superior value to the marketplace than companies that provide a broad, generalized offering.

According to Porter, an organization has two options: cost optimization through standardization and value creation through differentiation. Differentiation means becoming more specific in one or more aspects of your value proposition or business model.

Due to the globalizing economy and growing emphasis on niche markets, organizations are increasingly focussing on differentiating their business activities. The goal of differentiating business activities is to increase competitive advantage. Every organization has activities that are core to their operations.

On the other hand, organizations carry out activities that are not core to their operations: generic activities. These activities are generally performed in a similar way in organizations. In the event that activities are of a generic nature, in many cases best practices and standard solutions can be chosen to support these activities. These activities can also be good candidates for outsourcing. Outsourcing generic activities allows organizations to focus on their core activities.

4.1

TWO REASONS FOR DIFFERENTIATION

In practice, we see two different reasons for an organization to differentiate: strategic choice and necessity.

In competitive markets, organizations try to find ways to increase the differentiation of their activities from the competition. Organizations are constantly looking for ways to differentiate and innovate their activities to increase and maintain competitive advantage; a strategic choice.

However, we also identify a less voluntary form of differentiation: differentiation by necessity. Organizations that are forced to differentiate their activities. There is no other option. Some examples to illustrate differentiation by necessity:

- In healthcare, specialists are forced to specialize certain medical practices to ensure that they are sufficiently competent and make full use of the available medical infrastructure. This is determined by law.
- An organization is created specifically to carry out certain activities, such as the tax authorities, the Land Registry, execution of social benefits programs. There is no choice to differentiate. The law prescribes which regulations they are supposed to carry out. This is specialization by necessity. These institutions generally organize on the basis of what the law prescribes in terms of implementation.

Differentiation has consequences for organizing data and technology. In general, organizations cannot use market solutions to support such differentiated activities in a standard way; in such a case, a market solution must be tailored to customer-specific requirements. Differentiation also implies that organizations must have and rely on specific technological expertise to develop, operate and maintain the required digital technology. However, support activities (Porter) for this type of organization, may be generic.

4.2

SOURCES OF SPECIFICITY

Differentiating activities often require a source of specificity that enables the organization to differentiate. By identifying the source of specificity, it is easier to determine why it is there and whether it should be increased to enhance differentiation by choice, or decreased to reduce differentiation by necessity. Examples of sources of specificity are:

1. Tangible resources: Some activities require specific assets to carry out the activity. These are assets that are specific to the firm and not owned or easily purchased by competitors.

2. Intangible resources: The IP, knowledge, skills, expertise or data used in some activities can be considered specific and core to a company. These intangible assets are then mission critical to the organization. Intangible assets are not easily tradeable and are built up over time.

3. Laws and regulations: Law and regulations that an organization must comply with may affect the way a business activity should be conducted and this may result in higher costs. In addition, this can place significant demands on systems in terms of setting up technology to support a business activity.

4. Location of the activity: the location where the business activity is conducted can affect the business activity and its design. A restaurant by the sea can attract more customers because it is distinctive, but also requires more logistical organization to handle all types of deliveries.

5. Timing of the activity: the timing of performing an activity influences the organization of an activity, especially when the timing deviates from the standard. One example is seasonality in certain markets, or highly time-critical activities. Standard software solutions may not be able to accommodate this deviating timing.

6. Political factors: Conscious choices made by upper management in an organization can affect the way a business activity is conducted. For example, a CxO wants to keep using software because it has been in use for years, even if it may not be the cheapest or most suitable option.

‘Increasing competition puts the focus on differentiation.’

CHAPTER 5
MULTIMODALITY

In the previous chapters, two dimensions of business activities have been discussed:

- Dynamics: the strategic choice on how to deal with changes in the environment
- Differentiation: which business activities are distinctive.

These two dimensions form the basis of the MultiModal Business Activity Model. This model recognize four different types of business activities: modalities. These modalities provide insight into the characteristics of a business activity when placed in a particular quadrant of the model. The classification of business activities in modalities gives direction to the organization of the business activities and data, the choice for a technological solution, the choice for sourcing and collaboration with third parties.

Each modality has a color. The use of different colors supports communication and discussion.

- *Distinct activities (purple)* are business activities that are specific and responsive. They are business activities that play a central role in the development of new and innovative products and services in response to changing customer demands or in response to developments in society, technology, or the actions of competitors. Example: developing sustainable alternatives for existing services and products, or products and services tailored to the wishes of customers.

- *Specialized activities (orange)* are activities that take place in a relatively stable environment and are specific because they require special knowledge, resources, methods. Specialized activities distinguish themselves in finding specific and often complicated solutions or results by applying specific knowledge, expertise and resources to more or less defined problems. Think of technical maintenance of complex infrastructure, time-critical processes, integration issues, specialist work in hospitals or

‘Do not go into specific details of the ‘how’, but focus on ‘what’ to achieve’.

FIRST APPLICATION OF THE BUSINESS ACTIVITY MODEL
The model was first developed in 2014 on a client assignment where Anderson MacGyver was asked to review their application portfolio with the objective to rationalize, modernize, and identify cost reductions. Therefore, we looked for a way to link the applications portfolio to the business objectives. We did this by linking applications to business activities and business activities to business objectives. For example: Several logistics applications were in use. The challenge for logistics was to operate faster, more reliably and more cheaply. The challenge for the tech & data organization was to move to a single application, harmonize logistic processes across locations and choose a market solution. The aim was to eliminate the existing differentiation of multiple, integrated systems for the logistics sector, which are relatively stable in themselves. This analysis was carried out for all business activities by plotting the applications in use on the business activities. The characteristics of the business activities determined the rationalization of the application portfolio.

Based on this analysis, recommendations were then made for each business activity or group of business activities. The recommendations were based on the characteristics of the business activity: market solutions for generic activities; for specific and distinctive activities, custom build or flexible specialized market solutions that respond to the dynamics of the business environment. The latter then from suppliers with extensive knowledge of the business domain.This assignment formed the basis for Anderson Macgyver’s multimodal perspective.

organizations charged with the implementation of specific legislation, such as the tax authorities.

- *Common activities (green)* are business activities that are characterized by a relatively stable environment and that are no different from comparable activities at other organizations. Common activities are usually designed to provide good and reliable products, services or results with a good price/performance. The activities are relatively stable over time. Examples of common activities are support activities such as administration, purchasing. and primary activities of companies that provide products and services that compete on price with comparable products of competitors.

- *Adaptive activities (blue)* are business activities that have relatively high dynamics, but that do not differ in specific features from comparable activities, products or services of other organizations. Adaptive activities are often adapted in response to changing customer demands or developments in society or technology. The activities are dynamic in time. The activities themselves do not distinguish companies from other organizations with which they compete. Examples of adaptive activities are commercial and support activities that need to be continuously adapted to the actions of competitors or as a result of rapidly changing environmental conditions, such as the use of new technologies or changing consumer preferences in the world of fashion, entertainment or social media.

In practice, determining the modality of a business activity has proved to be not only a practical and simple tool to analyze organizations, but also an excellent tool for conducting conversations, discussions and workshops. The tool facilitates defining what an organization does and why, aligns stakeholder perspectives and helps to jointly determine the future strategic direction of business activities. Talking about business activities without going into specific details of the 'how' keeps the discussion focused on what the organizations want to achieve without getting bogged down in discussions about the details of the 'how'.

CHAPTER 6
APPLICATION OF THE MODEL

The model has been in use at Anderson MacGyver since 2014. It is used in one form or another in practically all our assignments to gain an unambiguous understanding of the organization and its business model. The model gives direction to the organization of tech & data. Whether it is about designing tech organizations, governance of tech and data services, supplier selection, enterprise architecture or application rationalization. The model can be used for various purposes. Below are some examples of the model's application possibilities.

6.1

STRATEGIC ORIENTATION FOR A SPECIFIC BUSINESS ACTIVITY

The strategic orientation differs per modality. The strategy for activities qualified as 'common' is fundamentally different from that for 'distinct' activities. The focus for stable business operations will be more internal: internal objectives, implementing improvements that lead to better utilization of company resources. For dynamic activities, the focus will be much more outward: what is happening, how can the company continue to distinguish itself. If differentiation is of strategic importance, then maintaining that distinction will be of strategic and critical importance unless the strategic need for this specificity disappears.

6.2

OUTPUT OR RESULT CHALLENGES

The type of output or result differs depending on the modality of the activity. In stable environments, the focus is mainly on implementing further standardization, automation, improving product quality and ensuring that the product is competitive in relation to the competitor's offer. Product variation is avoided. Specific results may be required to integrate business activities, to meet specific requirements, or because specific knowledge is necessary to achieve the required result. In dynamic environments the delivered result must continue to meet the expectations of the consumer. In this case the added value for the customer will be leading. It is important that the execution of activities can be flexibly adjust to changing needs and requirements. For 'distinct' activities, the challenge is to develop results that are and remain distinctive and unique.

6.3

CHANGING THE MODALITY

The modality of a business activity can change over time. It is therefore important to determine whether it concerns the modality in the 'as-is' situation or in the 'to-be' situation. A business activity may have become specific over the years, including its solutions. Strategically, a company may not want that. The company may choose to change the 'as-is' modality of a business activity to a desired 'to be' modality that supports its strategic goals. For example, from an old specific solution (orange) to a modern common solution (green). The same can happen on the horizontal axis of dynamics. Business activities aimed at interaction with the customer are becoming increasingly dynamic and require different solutions than in the past: less standard and more adapted to the needs of the customer, or from specific individual forms of customer service to new forms of service based on technological solutions with greater functionality. Making the change in modality visible also provides an immediate insight into what this means for the change in the characteristics of that activity.

6.4

PROCESS CONSIDERATIONS

Stable environments have stable processes that are managed with a high degree of automation for efficiency. Dynamic environments require activities and processes that effectively can be adapted quickly and easily. When specificity is important in processes, those processes will take specific characteristics that lead to specific and more complicated implementations of technology. For distinct environments, processes will focus on fast learning, short cycles and exploring possibilities to achieve results.

6.5

TECHNOLOGY IMPLICATIONS

Any technological solution must be in line with the characteristics and requirements of the business activities it supports. Common and adaptive activities will generally opt for standard market solutions from the market. In case of adaptive activities market solutions must be selected that support the dynamics of the markets supported by tech partners understanding the company's business. For the specialized and distinct modalities, the requirements must be set by the customer. The supplier provides specific expertise and capacity to its customer and can support them in learning new technologies or providing expert advice by helping them to realise their business vision.

6.6

SOURCING OPPORTUNITIES

Business activities with stable and generic characteristics (common activities) lend themselves well for outsourcing. Due to their stable and generic nature, technology partners can achieve cost and quality benefits through economies of scale. For specialized and distinctive activities a company has to define, design and develop the desired solution themselves. Sourcing in this case can contribute by providing specific knowledge and capacity to realize solutions faster. In a dynamic adaptive environment, it comes down to the quality and adaptability of the solution offered by the market. Knowledge of the business activities for which the supplier offers a solution is essential. For generic

market solutions, the customer focuses on making the best possible use of the solutions offered by the supplier. For the 'distinct' modality, suppliers with specific expertise can offer solutions to accelerate developments and reduce development risks.

6.7

IMPLICATIONS FOR GOVERNANCE

The governance of the activity will differ per modality. Stable operations will focus on deployment of resources, efficiency and the achievement of KPI's. If the activity is 'specialized', special attention will be paid to development of this specialized capacity and the associated risks. In dynamic activities, monitoring and control should mainly focus on whether adjustments to the activity are effective. Testing and customer feedback are important, as is continuously verifying that the activity is best practice. In case of 'distinct' activities, the development process is guided by intermediate results and the functioning of stakeholder feedback.

6.8

LEADERSHIP STYLES A GROUP OF COHERENT ACTIVITIES

Each of the modalities have different leadership styles. This aspect is further elaborated in the White Paper 'Organizing data and technology'. This is related to the culture and leadership model of Cameron and Quinn (2006). The most important features are described below. 'Common' activities have a more hierarchical leadership style that focuses on control and efficiency of the processes within the activity. Agreements and KPIs with employees can provide room for self-improvement, whith the leader facilitating and monitoring. 'Specialized' requires more teamwork and space for the specialist to design and implement his solutions. Facilitation and further development are important. 'Distinct' requires vision and entrepreneurship to involve employees and other directly involved stakeholders in the process. Communication and teamwork are important. 'Adaptive' requires a competitive attitude for continuous adjustment with a focus on achieving goals and the stakeholders involved in a dynamic environment.

6.9

FINANCIAL CONTROL CONSIDERATIONS

There are also differences between the modalities for 'financial control'. Stable activities will be managed primarily on the basis of costs and performance. For 'specialized' this is mainly based on the utilization of budgets and prioritising the purpose for which that budget is used. In many cases there are unavoidable costs that are directly related to the specific character of a business activity (necessity). For dynamic activities, the yield is important: the concrete result of the adaptation (adaptive) or the expected return of an investment in new services or products (distinct). Risk management through scenario planning and time boxing of the investment is important.

The above gives a good but global insight into the application and the benefits of the multimodal business activity model.

'Multimodality is a means for creativity and gives meaning to digital transformation.'

CHAPTER 7
A FEW CLOSING WORDS

Multimodality is an important starting point for determining the way to organize data and technology. It is therefore our starting point for designing tech organizations, governance of tech and data services, vendor selection, enterprise architecture and application rationalization.

Properly identifying the characteristics and requirements of business activities is strategic for selecting or building the right tech and data solutions; whether using best practices, adopting standard solutions, or building partnerships with third parties.

Multimodality of business activities has proven to be an excellent means of aligning stakeholders, which is one of the key requirements for a successful digital transformation. The modality approach makes it relatively easy to invite different stakeholders and tech and data people to discuss the business activities and their characteristics (inside and outside your organization). It is a conversational tool that creates a shared language, it focuses on the why and what needs to change in a business activity or group of activities amongst a group of stakeholders.

Anderson MacGyver uses the concepts and thinking behind multimodality in almost every client assignment. The explanation of the model is simple. It is a product of our consulting practice and it has been academically validated. The concept of multimodality supports a modern way of thinking to define scenarios tailored to the characteristics of business activities. It takes into account the differences between business activities and the difference in importance to the business.

It brings back the discussion about technology and data to its users, recognizing the need for coherence, for sharing knowledge and exploiting the benefits of collaboration between the different business domains and their business partners.

‘Multimodal thinking unites business, tech and data in digital transformation.’

ABOUT ANDERSON MACGYVER

Anderson MacGyver supports its clients in creating business value by setting up establishing digital strategies, implementing business focused and agile technology organizations, and selecting the right 'fit for purpose' solutions and technology partners. By doing so, we help our clients with their digital transformation. Essential to the digital transformation is a clear roadmap for a future where companies use data and technology to create a competitive advantage.
Anderson MacGyver challenges the clients' business strategy and helps define their strategic digital agenda.

NEW BUSINESS MODELS

Markets are changing rapidly; existing business models are under great pressure and are challenged by radical new business models delivered by new digital organizations (e. g. 'Uber' or FinTechs). Over the last decade, the increasing pressure on efficiency has made IT environments obsolete resulting in business managers being dissatisfied with their internal IT organization. Smarter use of information is becoming the key enabler of new business models.

PARTNERING WITH THE BUSINESS

At Anderson MacGyver, we believe that IT organizations should act first and foremost as a business partner, constantly thinking and acting in terms of added value to the business and its customer. As a result, opportunities involving technology and information will be seized more effectively. No longer 'IT and the business', but working together in multimodal teams towards one vision and strategic approach of the customer.

DIGITAL TRANSFORMATION

Anderson MacGyver is dedicated to helping clients with their digital journey. A future in which organizations leverage data and technologies to create new opportunities and gain a competitive advantage, and in which organizations have the adaptability to respond to and grow with the evolving society and markets. Anderson MacGyver operates as a change agent throughout all stages of digital transformations.

ANDERSON MACGYVER AS A TEAM

Anderson MacGyver supports organizations with its own authentic approach to achieve the intended goals. We initiate innovation with true passion and create a challenging and exciting strategic digital agenda together with our clients. Business is poised to become a leader in tomorrow's digital world through a modern and focused organization.

We are committed to helping our clients and making the necessary changes in their organization. We are recognised for the seniority, drive, and experience of our teams and their commitment to making an impact. By applying our methodologies, based on the latest scientific insights, we are passionate about initiating innovation and helping our clients transform.
